1.2 Document Purpose

The Smart Stock development team utilizes this Software Requirements Specification as the primary technical reference to ensure all project objectives are met with precision. The document establishes a comprehensive framework for addressing the operational challenges of small scale restaurants through AI-driven demand forecasting and NLP-based assistance systems. By defining the operational boundaries of a cloud-native environment alongside a BYOD model, this SRS serves as the fundamental guide for Quality Assurance and system validation throughout the two semester development lifecycle. All technical resources are focused on the core objectives of reducing food waste and optimizing procurement efficiency, ensuring the project remains within scope while delivering high-quality, actionable results.

1.4 Audience

Our target audience would consist of small-scale restaurants, startup food businesses, and low budget independent owners who rely on manual or spreadsheet based inventory management due to limited budgets and technical resources for managing inventory. This includes business owners, managers, and staff handling inventory with limited technical experience, needing a simple, low-cost system that will help with food waste and prevent stock shortages. Smart Stock is designed to improve these businesses quality of life with AI-assisted inventory intelligence that was only accessible to larger restaurant chains.

1.5 Group Agreement

Team 4

Project Title

Smart Stock

Project Time Frame

3 months and 2 weeks

Team Members

- Parsa Tahmasebi
- Jun Ho Jeon
- Andy wei

Section 2

2.1 Project Proposal

2.1.1 Project Background

This project aims to improve the daily operations of small scale companies such as local restaurants in regards to inventory management. Unlike big corporations where the ordering of products has a systematic approach due to collaboration of multiple companies to keep the system going, smaller companies have to manually order and handle the supplies.

In order to improve the situation our group has decided to create a solution for this issue while keeping in mind the limitations of those smaller companies. However before explaining the whole idea we first need to take a look at why we are doing this in the first place. No matter the amount of precision or attention to details we as humans always make mistakes as the sheets might get damaged or any other reason which can result to loss of the inventory counts. However by inputting them into a well built system and having copies of the documents safely stored in different locations in daily/weekly basis we can prevent a lot of the issues from happening.

Further more to help with the process and make it even easier for employees and members of the company, we have thought of adding a touch of AI to the project which will be focused on making the data more understandable and process of ordering easier.

2.1.2 Problem Statement

The primary challenge small-scale restaurants faced was the absence of accessibility of automated infrastructure for inventory management. In an industry where **profit margins** are **notoriously thin**, the **lack of precision in tracking materials** such as food items can cause **financial** and **operational burden**. Currently, these most of these small businesses operate within a “**technological gap**”, being forced to decide between primitive manual methods and expensive enterprise-level software that is both financially and functionally an issue.

The issue mostly lies on the manual tracking done by a human, and being human nature there would always be mistakes somewhere. Most restaurant startups use paper logs, physical counts, and basic spreadsheets to manage their stock. These methods can always be flawed, being **time consuming** and highly susceptible to **human error**, especially when performed by a staff during high pressure shifts. This inaccuracy could lead to issues such as **overstocking** or **sudden stockouts** which **constricts** restaurants from gaining that more revenue.

The impact of this problem is most severe for independent cafes and startup food entrepreneurs. Because these owners often manage every aspect of the business themselves, from cooking to accounting, this usually leads to the **lack of time** to maintain complex manual logs. Every hour taken from manually auditing a spreadsheet is an hour taken away from more business growth. Especially with how **poor inventory management** becomes a “silent killer” of profitability which then leads to unnecessary expenses that small businesses simply cannot take.

2.1.3 Product Vision

Our vision for our product Smart Stock is to develop a cloud-based, AI assisted inventory management system designed specifically to the needs of small scale restaurants and businesses. As a group, we aim to provide a practical, realistic and accessible solution that replaces unreliable manual tracking methods with a platform that delivers accurate and real time insights.

Smart Stock will utilize historical inventory and sales data to perform “smart” demand forecasting, allowing businesses to anticipate stock requirements, minimize food waste, and avoid possible shortages. We aim to incorporate an NLP based assistant that allows users to access information and receive recommendations through natural language queries, making the whole system intuitive for users no matter their technical experience or level.

Ultimately, we envision Smart Stock as an affordable, scalable, and easy to deploy solution to help small businesses and equip them with actionable insights, inventory workflows, reduced waste and sustainable operations.

2.2 Stakeholders and Users

Stakeholder Name	Project Role	Internal/External	Engagement Level	Level of Interest	Level of Power
Development Team (Parsa, Jun Ho, Andy, Nikan, Ivan)	System Architects & Developers	Internal	Leading	High	High

Small-Scale Restaurant Owners	Primary Target Audience & Decision Makers	External	Supportive	High	High
Restaurant Managers/Staff	End-Users (Daily Inventory Tracking)	External	Consulted	High	Medium
Course Faculty	Project Evaluators & Supervisors	External	Leading	High	High
Local Food Suppliers	Information Sources for Pricing Comparison	External	Neutral	Low	Low
Cloud/AI Service Providers (AWS, OpenAI)	Infrastructure & API Providers	External	Neutral	Low	Medium

2.3 Project Scope

Smart Stock is designed to provide small businesses with an affordable system that offers real time inventory tracking, allowing users to monitor ingredient quantities, receive low-stock and expiry alerts, and maintain accurate digital records while all being processed through AI helping the users understand the data and process of ordering a lot easier, the system will also offer a module that lets users compare ingredient prices from local suppliers and helps the user make financially better decisions. Additionally, Smart Stock is provided with an interactive web-based dashboard, automated reporting tools, and an AI assistant that helps non-technical users navigate through the system efficiently.

However, Smart Stock systems do not provide the business with any functions for processing payments, managing payroll, or handling employee scheduling. The system cannot automate supplier ordering or making final financial transactions for the user, Instead it will provide recommendations and insights on the best course of action for the business, leaving the decision up to the user to decide to follow the recommendations or not. The system will also not support large enterprise-level restaurant chains, as our focus is more on small businesses. Finally, Smart Stock cannot guarantee perfect predictions as AI is dependent on data quality and trends, and is intended to assist, not replace human judgement.

2.4 System Risks

The following table categorizes the potential risks associated with the development and deployment of Smart Stock.

Risk Category	Risk Description	Probability	Impact	Risk Score
Market	Low adoption rate by local restaurant owners.	Medium	High	High
Financial	Unexpected cloud infrastructure (AWS) costs.	Low	Medium	Medium
Technology	Inaccurate AI predictions due to poor data quality.	Medium	High	High
People	Team member unavailability or skill gaps.	Low	High	Medium
Structure	Inefficient group planning errors.	Medium	Medium	Medium

2.5 Operating Environment

To ensure Smart Stock remains accessible and affordable for small businesses, the operating environment is going to be designed to be lightweight and cross-platform as a web based system with a cloud infrastructure.

- Hardware/Devices Supported
 - Handheld Devices: Optimized for quick inventory counts on the go
 - Tablets: Recommended for manager use
 - Desktop/Laptops: Supported as it is on a web browser for possible deep dive data analysis or setup
- Operating System Dependencies
 - Mobile: Android and IOS
 - Desktop: (Windows, macOS, Linux) as it will run through modern web browsers
- Software Dependencies
 - Web Browser: Modern browsers with HTML5 support (Chrome, Firefox, Safari, Edge, Opera)
 - Cloud Infrastructure: Hosted on AWS to manage database storage
 - AI Models: Integrated with APIs (ex., OpenAI API or OpenRouter API) for "Smart Assistant" feature.
- Internet Connection Required
 - Required: As this will be a web based system, a stable internet connection is necessary for data syncing and AI support.

2.6 Functional Requirements

2.7 Nonfunctional Requirements

2.8 UI/UX Interface Mock-ups

Section 3

3.1 Data Flow Diagrams

3.2 User Stories and related Use Case Scenarios

3.3 Activity Diagrams

3.4 Business Rules
